1. General information

1,1 INTRODUCTION

The 25MHz dual-channel oscilloscope PM 3212 is a compact, lightweight instrument, featuring ergonomic design and extensive measurement capabilities.

A large 8×10 cm screen, with internal graticule lines, a high intensity trace together with features such as TV triggering, switchable trigger modes and adding modes for the vertical channel, make this instrument suitable for a very wide range of use.

A double-insulated power supply allows the frame ground to be directly connected to floating ground circuits provided this ground does not carry live potentials.

Interference by ground currents, as is frequently experienced with grounded oscilloscopes, is also substantially reduced.

Use of the oscilloscope in the field is further facilitated by optional battery operation.

Warning: The frame ground (and the probe's ground lead) must not be connected to live potentials.

2. Directions for use

2.1 INSTALLATION

2.1.1 Safety regulations (in accordance with IEC 348)

Before connecting the instrument to the mains (line), visually check the cabinet, controls and connectors etc., to ascertain whether any damage has occured in transit. If any defects are apparent, do not connect instrument to the mains (line).

The instrument must be disconnected from all voltage sources, and any high voltage points discharged before any maintenance or repair work is carried out. If adjustments or maintenance of the operating instrument with covers removed is inevitable, it must be carried out only by a skilled person who is aware of the harzards involved. In normal operation the double-insulated power supply obviates the need of a safety ground.

Warning: It must be borne in mind that in all measurements the frame ground of the oscilloscope is raised to the same potential as that of the measuring ground probe connection.

Neither the probe's ground lead nor the frame ground shall be connected to live potentials.

2.1.2 Local mains (line) connection and fuse protection

Before connecting the instrument to the mains (line), make sure that it is set to the local mains (line) voltage. On delivery the instrument is set to 220 V. If the instrument is to be used with 110 V, 127 V or 240 V supply, the appropriate voltage should be selected by turning the adaptor on the rear panel to indicate the voltage required (see Fig. 2.1)

The instrument is protected from overloads by a thermal fuse fitted between the mains (line) transformer windings. It can be replaced after having removed the instrument rear panel (see section 3.2)

Fig. 2.1. Rear view of the oscilloscope showing the voltage adapter set to 110 V.

2.1.3 Connection to an external supply

An external supply or battery of 21 V to 27 V capable of delivering at least 1 A can be connected to the socket on the rear panel.

The inner conductor must be connected to the negative pole and the outer conductor to the positive pole, as indicated on the rear panel.

The instrument is protected against overloads and wrong polarity by an internal fuse and diode.

2.1.4 Front cover and instrument position

The front cover can be simply removed by pulling it from the front.

The instrument may be used horizontally or in several sloping positions by using the carrying handle as a tilting bracket. To unlock the handle, simultaneously push in both pivot centre knobs.

2.2 CONTROLS AND SOCKETS (Refer to fig 2.2)

2.2.1 Cathode-ray tube and POWER controls

ILLUM

POWER ON Continuously variable control of the graticule illumination; incorporates mains

(line) switch. Pilot lamp indicates the ON state.

INTENS Continuously variable control of the trace brilliance.

FOCUS Allows beam to be focussed for minimum spot size

TRACE ROTATION Screwdrive adjustment to align the trace with the horizontal graticule lines.

Fig. 2.2. Front view of the oscilloscope showing controls and sockets

2.2.2 Vertical channels

Display mode switch

Function

5-way pushbutton switch selecting the vertical display mode. With all buttons released, the ALT mode is in operation.

Α

Vertical deflection is achieved by the signal connected to the input of channel A.

ALT

The display is switched over from one vertical channel to the other at the end of

every cycle of the time-base signal.

CHOP

The display is switched over from one vertical channel to the other at a fixed

frequency, (f $\approx 500 \text{ kHz}$)

ADD

Vertical deflection is achieved by the sum signal of channels A and B.

В

Vertical deflection is achieved by the signal connected to the input of channel B.

POSITION

Continuously variable controls giving vertical shift of the display.

PULL TO INVERT B

Push-pull switch combined with the channel B POSITION control. When pulled,

channel B signal is inverted.

AMPL/DIV (outer)

Step control of the vertical deflection coefficients, ranging from 2 mV/div up to

10 V/div in a 1-2-5 sequence.

AMPL/DIV (centre-knob)

Continuously variable control of the vertical deflection coefficients. Note that the deflection coefficient is calibrated only with the centre-knob switched to the

CAL position (fully-clockwise).

Input coupling switch

Signal coupling; 2-way pushbutton switch

AC (depressed)

Coupling via a blocking capacitor

DC (released)

Direct coupling

0 (depressed)

Connection between input circuit and input socket is interrupted and the input

circuit is grounded.

Α

BNC socket for channel A input

В

BNC socket for channel B input

2.2.3 Triggering

Trigger mode switch

Function

5-way pushbutton switch, selecting the trigger mode and the polarity of the trigger transition. With all pushbuttons released AUTO sweep mode is in operation

at a fixed range of the LEVEL control.

AUTO

A trace is displayed in the absence of trigger signals. The range of the LEVEL to n-

trol is proportional to the peak-to-peak value of the triggering signal.

AC

Normal triggering and fixed range of the LEVEL control. DC component of

trigger signal is blocked.

DC

Normal triggering and fixed range of the LEVEL control. DC component of

trigger signal is passed.

TV

Line or frame synchronisation is obtained as dictated by TIME/DIV switch (frame from . 5 s/div to 50 μ s/div and line from 20 μ s/div to . 2 μ s/div).

+/-

Sweeps are triggered on positive or negative-going trigger signal transitions. In TV, - must be selected for negative video signals and + for positive video signals.

LEVEL

Control for continuously varying the level of the waveform on which the display is to start.

TRIG OR X DEFL.

See TRIG or X DEFL source switch in section 2.2.4. below.

2.2.4 Horizontal channel

TRIG or X DEFL source

Function

switch

4-way pushbutton switch selects the trigger source or the source of horizontal deflection if the TIME/DIV switch is the X DEFL position. With all pushbuttons released source A is selected.

Α

Signal derived from channel A

В

Signal derived from channel B

COMP (A & B both

depressed;

inoperative with X DEFL)

Signal derived after the electronic channel switch. Triggering occurs on the

waveforms as presented on screen.

EXT

External signal as applied to the adjacent 1 Mohm//20 pF socket

LINE (MAINS)

Signal derived from the line (mains) voltage. (Not operable when instrument is

supplied by battery.)

X POSITION,

X MAGN

Continuously variable control giving horizontal shift of the display; incorporates a push-pull switch which increases the horizontal deflection by a factor of 10.

TIME/DIV (outer part)

Selects the time coefficient from .2 μ s/div to .5s/div in a 1-2-5 sequence. Dictates line or frame triggering in TV mode. In position X DEFL horizontal deflection is determined by TRIG or X DEFL switch.

TIME/DLV (centre knob)

Continuously variable control of the time coefficients. Must be in CAL position (i.e. fully clockwise) for the time axis to be calibrated according to the indication of the TIME/DIV switch.

2.2.5 Miscellaneous

CAL

Output socket supplying a squarewave of \approx 2 kHz and an amplitude of 3 $V_{D-D}\pm$ 1%. To be used for probe compensation and/or checking vertical deflection accuracy.

External supply

Input socket at the rear of the instrument allows the instrument to be operated by an external d.c. supply. Rated supply voltage 21 V to 27 V, current capability > 1A.

LINE (MAINS) VOL-TAGE ADAPTOR

Must be set according to section 2.1.2 before the instrument is connected to the local mains voltage.

2.3 OPERATING INSTRUCTIONS

2.3.1 Switching on the instrument

Before connecting the instrument to any supply, the instructions given in section 2.1 Installation, should be carefully carried out.

The oscilloscope will meet specifications (see section 1.2) normally after a waming-up period of approximately 15 minutes. However, if the instrument has been subjected to an extremely cold environment (e.g. left in a car overnight in freezing conditions) and is then brought in for use in a warm room, a warming-up period of sufficient length should be allowed (see 1.2.8.)

2.3.2 Preliminary settings of the controls

This procedure is a general indication of whether the oscilloscope is functioning correctly and provides a suitable starting point before any measurements are made.

Refer to Fig. 2.2 for location of controls.

Set INTENS and FOCUS controls in mid position.

Depress AUTO and select an average time coefficient between 10 μ s/div and 10ms/div with the TIME/DIV switch. With all other pushbuttons normal (not depressed) channel A and channel B traces can be positioned on the screen with the relevant POSITION controls. Set the INTENS control for a display of medium brightness and adjust FOCUS control for well focused traces.

2.3.3 Input coupling (AC/DC, 0)

AC coupling (pushbutton depressed) is useful to block the d.c. component of a signal. Choice of AC limits the lower frequencies, causing low repetition rate sinewave signals to be attenuated and low repetition rate square-waves to be distorted. The degree of attenuation is determined by the input RC time (0.1s). Input RC time is extended by 10 if 10:1 passive probes are employed.

When switching to AC coupling it will take approximately five input RC times before the trace is stabilised to the average value of the input signal.

AC position measurements cannot be made with respect to ground.

O position disconnects input source and short-circuits input of amplifier to provide zero signal check.

DC coupling (pushbutton released) provides for full range frequency input, i.e. down to d.c.

2.3.4 Use of probes

1:1 passive probes should only be used for d.c. and low frequencies.

Capacitive loading attenuates high frequencies or increases the rise-time of measurement signals (dependent on source impedance).

10:1 passive probes have less capacitive loading; usually about 10pF to 20pF. FET probes are superior, especially when measurements are to be taken from high impedance test points or at the upper frequency limit of the oscilloscope bandwidth.

10:1 passive probes must be properly compensated before use. Incorrect compensation leads to pulse distortion or amplitude errors at high frequencies.

For correct adjustment, the CAL output connection can be used (see Fig. 2.3.)

2-3.5 Selection of chopped or alternate modes

(A ALT CHOP ADD B)

In dual channel operations (CHOP or ALT depressed) the chopped mode (depress CHOP) must be selected for relatively slow sweep speeds (from .1ms/div to .5 s/div) or at low repetition rates of sweeps occurring, even at high sweep rates. Selection of the ALTernate mode under these circumstances would make comparisons between waveforms difficult because traces would actually appear to be written one by one. However, when the displaries fast enough to be interrupted by the chopping frequency the alternate mode must be selected (depress ALT), usually at sweep rates faster than .1 ms/div.

Fig. 2.3. How to compensate passive 10:1 probes and the effect on waveforms

2.3.6 Differential mode

The A - B mode can be selected by depressing ADD and pulling the channel B POSITION control.

In measurements where signal lines carry substantial common mode signals (e.g. hum) the differential mode will cancel out these signals and leave the remainder of interest (A - B). The capability of the oscilloscope to suppress common mode signals is given by the CMR factor (see Fig. 2.4).

To obtain the degree of common mode rejection as specified, channel A and B gains must first be equalised. This can be done by connecting both channels to the CAL output connector, and adjusting one of the continuous controls with the AMPL/DIV switch for minimum deflection on the screen.

When passive 10:1 probes are used a similar equalisation process is recommended by adjusting their compensating controls for minimum deflection.

Fig. 2.4. Suppression of common mode signals

2.3.7 Selection of trigger mode

(AUTO AC DC TV +/-)

The AUTO mode is most useful because it provides trace(s) on the screen even in the absence of trigger signals. Furthermore, for a signal amplitude larger than 1 division, this mode provides stable triggering independently of the position of the LEVEL control; its range is automatically adjusted to the peak-to-peak value of the signal selected for triggering.

In this way the setting of the LEVEL control is facilitated at small amplitudes of the trigger signal.

The AUTO mode cannot be employed for signals with low repetition rates (10 Hz or lower) because the sweeps would be able to free run in between triggers. Therefore, for low repetition signals normal triggering must be used (AC or DC depressed).

In normal triggering, sweeps are only initiated with a trigger signal applied and the LEVEL control set approxiately.

With AC or DC depressed the range of the LEVEL control is fixed (+ or -8 divisions or more at the extremes of the LEVEL control with respect to mid screen).

The DC component in the trigger signal can be blocked by depressing AC. This is useful when triggering must take place on a.c. signals superimposed on a large d.c. level.

With AC coupling, the level at which the display starts will change with alterations in the average value of the trigger signal. The trigger level is thus no longer referenced to signal ground. This may cause instability with waveforms that vary in time interval from cycle to cycle. Normally it is preferable to use the DC position.

Slope selection is made with pushbutton +/-. In TV mode — must be selected for negative video signals and+ for positive video signals. The LEVEL control is inoperable in the TV mode.

No buttons depressed offers an extra mode of use, a trace is on screen in the absence of a trigger signal, but he LEVEL range is fixed.

2.3.8 Trigger sources

The trigger source is selected by the front-panel TRIG or X DEFL pushbuttons.

A B EXT LINE

- Internal triggering will be most commonly used because it requires only one signal (the input signal) to obtain stable triggering.
- External triggering. When tracing many signals it is advantageous to use an external signal for triggering. There is no need to set and reset the trigger controls (LEVEL, SLOPE and SOURCE) on changing the input signal.
 Furthermore the two A and B inputs remain free for examining waveforms.
- Selection of trigger source. In comparing waveforms that are a multiple of each other's frequency, always select the signal, that has the lowest repetition rate as the trigger source. Not doing so may lead to double pictures (chopped mode) or untrue time-shifts (alternate mode).
- Composite triggering. With internal triggering signals are obtained from either the A channel, the B channel preamplifier stages or, when COMP is selected by depressing both A and B pushbuttons, from the delay line driver stage that follows the electronic channel switch.

Composite triggering offers three advantages:

- 1. In differential mode (A B measurements) triggering is derived from the differential signal. Triggering is not disturbed by common mode signals.
- 2. For one channel operation it is not necessary to switch trigger sources from A to B or vice versa.
- 3. In the alternate mode, it is possible to compare signals that are not related in time.

Note: When composite triggering is employed in dual channel operation (chopped or alternate), and there is only one signal applied (to A or B input), stable triggering cannot be obtained. This is only normal since the trigger source is also switched from A to B (see Fig. 2.5).

- Line (mains) triggering is useful when the signal input is mains (line) frequency related.

Fig. 2.5. Block diagram of composite trigger circuit

2.3.9 XY Measurements

XY measurements are made with the TIME/DIV switch at X DEFL, the source of horizontal deflection being selected by the EXT X DEFL or TRIG pushbutton switch (A, B, EXT or LINE).

XY measurements provide a useful means of making frequency or phase shift comparisons by displaying Lissajous patterns.

Measurements can be made up to 100 kHz with less than 30 phase error between oscilloscope channels.

The sensitivity for the different XY modes is shown in the following table:

X DEFL.	SENSITIVITY
Α	AMPL/DIV A ± 10%
В	AMPL/DIV B ± 10%
EXT	0.5 V/div
LINE	8 divisions

1. Allgemeines

1.1. EINLEITUNG

Der 25 MHz Zweikanal-Oszillograf ist ein leichtes Kompaktgerät. Er ist ergonomisch kontruiert und besitzt vielseitige Messmöglichkeiten.

Ein grosser 8 x 10 cm Bildschirm mit Innenraster, eine sehr helle Schreibspur sowie solche Möglichkeiten, wie TV-Triggerung, umschaltbare Triggerungsarten und Addier-Betriebsarten für den vertikalen Kanal machen das Gerät für einen breiten Anwendungsbereich besonders geeignet.

Eine doppelt isolierte Stromversorgung erlaubt direkten Anschluss der Geräte-Erde an erdfreie Schaltungen, vorausgesetzt diese Mess-Erde führt keine berührungsgefährlichen Spannungen.

Interferenzen durch Erdströme, wie sie häufig bei geerdeten Oszillografen vorkommen werden auch wesentlich reduziert.

Der Einsatz des Oszillografen im Freien wird durch wahlweisen Batteriebetrieb erleichtert.

WARNUNG: Die Geräte-Erde (und die Messkopf-Erdleitung) darf nicht mit berührungsgefährlichen Spannungen verbunden werden.

Fig. 1.1. 25 MHz Zweikanal-Oszillograf

2. Gebrauchsanleitung

2.1. INBETRIEBNAHME

2.1.1. Sicherheitsvorschriften (den IEC 348 Bedingungen entsperchend)

Vor Anschluss des Geräts ist eine Sichtkontrolle des Geräts vorzunehmen, um festzustellen ob das Gerät möglicherweise während des Transports beschädigt wurde. Wenn irgend welche Defekte wahrgenommen werden darf das Gerät nicht and das Netz angeschlossen werden.

Vor Wartungs- oder Reparaturarbeiten ist das Gerät von allen Stromquellen zu trennen und müssen alle Hochspannung führenden Teile entladen sein. Wenn danach eine Kalibrierung, Wartung oder Reparatur am geöffneten Gerät unter Spannung unvermeidlich ist, so darf das nur durch eine Fachkraft, die die damit verbundenen Gefahren kennt, geschehen. In Normalbetrieb erübrigt die doppelte Isolierung der Stromversorgung die Notwendigkeit einer Schutzerde.

WARNUNG: Es ist zu beachten dass bei allen Messungen die Gehäuseerde die gleiche Spannung wie die Messköpferde erreicht.

Weder die Messköpferdleitung noch die Gehäuseerde dürfen mit berührungsgefährlichen Spannungen verbunden werden.

2.1.2. Örtlicher Netzanschluss und Sicherung

Vor dem Anschliessen an das Netz ist zu prüfen, ob das Gerät für die örtliche Netzspannung eingestellt ist. Das Gerät wird eingestellt auf 220 V geliefert. Falls das Gerät mit einem 110 V, 127 V oder 240 V Netz verwendet wird, ist die geignete Netzspannung mit Hilfe des Spannungsumschalters an der Geräterückwand so einzustellen dass er die erforderliche Spannung anzeigt (siehe Abb. 2.1.). Das Gerät is durch eine zwischen den Wicklungen des Netztransformators angebrachte Thermosicherung gegen Überlastungen geschützt.

Die Sicherung lässt sich nach Abnahme der Gehäuserückwand ersetzen (siehe Abschnitt 3.2.).

Fig. 2.1. Rückansicht des Oszillografen mit Spannungsumschalter in 110 V Stellung

2.1.3. Anschluss an eine externe Stromversorgung

Eine externe Stromversorgung oder eine 21 V bis 27 V Batterie die zumindest 1 A liefern kann lässt sich an die Buchse an der Geräterückwand anschliessen.

Der Innenleiter muss an den Minuspol und der Aussenleiter an den Pluspol angeschlossen werden, wie an der Rückwand angegeben. Gegen Überlastungen und Polaritätswechsel is das Gerät durch eine interne Sicherung und Diode geschützt.

2.1.4. Abdeckhaube und Betriebslage

Die Abdeckhaube lässt sich auf eine einfache Weise durch Ziehen von der Gerätefront abnehmen. Das Gerät darf in waagrechter Lage oder mit Gebrauch des Tragsbügels als Kippbügel in verschiedenen Schrägstellungen aufgestellt werden. Um den Tragbügel zu entriegeln, gleichzeitig die beiden Lagerzapfenknöpfe eindrücken.

2.2. BEDIENUNGSELEMENTE UND BUCHSEN Siehe Abb. 2.2.

den horizontalen Rasterlinien.

Fig. 2.2. Vorderansicht des Oszillografen mit Bedienungsorganen und Buchsen.

2.2.2. Vertikale Kanäle

Darstellungsart-Schalter Funktion

Fünffacher Druckknopfschalter zur Einstellung der Darstellungsarten. Wird keine Drucktaste betätigt, dann ist Betriebsart

ALT eingeschaltet.

A Vertikalablenkung durch ein an Eingang von Kanal A gelegtes

Signal.

ALT Das Bild wird am Ende jedes Zyklus des Zeitablenksignals

von einem Vertikalkanal auf den anderen umgeschaltet.

CHOP Das Bild wird mit einer Festfrequenz von einem Vertikalkanal

auf den anderen umgeschaltet (f \approx 500 kHz).

ADD Vertikalablenkung durch die Summe der Signale von

Kanal A und B.

B Vertikalablenkung durch ein an Eingang von Kanal B gelegtes

Signal.

POSITION Stufenlose Einstellung der vertikalen Verschiebung des Bildes

PULL TO INVERT B Zug-Druck Schalter kombiniert mit dem POSITION Schalter

von Kanal B. Wenn gezogen wird die Kanal B Signalpolarität

umgekehrt.

AMPL/DIV (Aussenknopf) Stufenweise Einstellung der Vertikalablenkkoeffizienten, von

2 mV/div bis zu 10 V/div in 1-2-5 Folge.

AMPL/DIV (Mittelknopf) Stufenlose Einstellung der Vertikalablenkkoeffizienten. Es

ist zu beachten dass der Ablenkkoeffizient nur dann kalibriert is

wenn der Mittelknopf in Stellung CAL (ganz nach rechts)

steht.

Eingangskopplungsschalter Signalkopplung; Zweiweg Druckknopfschalter

AC (eingedrückt) Kopplung über einen Sperrkondensator

DC (ausgelöst) Direkte Kopplung

0 (eingedrückt) Verbindung zwischen Eingangsschaltung und Eingangsbuchse

unterbrochen und Eingangsschaltung geerdet.

A BNC-Buchse für Kanal A Eingang

B BNC-Buchse für Kanal B Eingang

2.2.3. Triggerung

Triggerungsart-Schalter Funktion

Fünffache Drucktaste zum Einstellen der Triggerungsart und der Polarität der Triggerflanke. Wenn keine der Drucktasten betätigt ist, dann ist Betriebsart AUTO gewählt, und der

LEVEL Bereich auf einen festen Wert eingestellt.

AUTO Ein Bild ist sichtbar auch wenn keine Triggersignale vorhanden

sind. Der Bereich der LEVEL-Einstellung ist proportional dem

Spitze-Spitze Wert des Triggersignals.

AC Normale Triggerung und fester Bereich der LEVEL Einstellung.

Gleichspannungskomponente des Triggersignals ist gesperrt.

DC Normale Triggerung und fester Bereich der LEVEL Einstellung.

Gleichspannungskomponente des Triggersignals wird durchgelauen.

TV Zeilen oder Bild Synchronisation je nach Stellung des

TIME/DIV Schalters (Bild von .5s/div bis 50 µs/div und

Zeile von 20 μ s/div bis .2 μ s/div).

+/--Triggerung auf der positiv oder negativ gerichteten Flanke des

Signals. In TV muss '--' für negative Videosignale eingestellt

werden und '+' für positive Videosignale.

LEVEL Stufenlose Einstellung des Signalformpegels bei welchem das

Oszillogram startet.

TRIG OR X DEFL (siehe TRIG OR X DEFL -Quelle Schalter im nachstehenden

Abschnitt 2.2.4).

2.2.4. Horizontaler Kanal

> TRIG OR X DEFL-Quelle Schalter **Funktion**

> > 4-fache Drucktaste zur Wahl der Triggerquelle oder der Horizontalablenkungsquelle wenn der Schalter TIME/DIV in Stellung X DEFL steht. Wenn keine der Drucktasten eingedrückt

ist wird Quelle A gewählt.

Α Signal, Kanal A entnommen

Signal, Kanal B entnommen

COMP (sowohl A wie B eingedrückt;

nicht wirksam mit X DEFL)

Signal ist jenem Kanal entnommen, der mit dem elektronischen

Schalter durchverbunden ist.

EXT Externes Signal wie an die angrenzende 1 Mohm//20 pF-Buchse gelegt.

LINE Signal von der Netzspannung (Nicht wirksam wenn das Gerät

batteriebetrieben ist).

Stufenlose Einstellung der vertikalen Lage des Bildes, einbezogen X POSITION X MAGN

ein Zug-Druckschalter für 10-fache Dehnung der Horizontalablenkung.

Einstellung des Zeitkoeffizienten von .2 μs/div bis .5 s/div in TIME/DIV (äusserer Teil)

1-2-5 Folge. Bestimmt Zeilen-oder Bildtriggerung in

TV-Betriebsart.

In Stellung X DEFL wird die Horizontalablenkung vom Schalter

TRIG OR X DEFL bestimmt.

TIME/DIV (mittlerer Knopf) Stufenlose Einstellung des Zeitkoeffizienten. Muss in Stellung

CAL stehen (d.h. ganz nach rechts) damit die Zeitachse gemäss

der Anzeige des Schalters TIME/DIV kalibriert ist.

2.2.5. Übrige

Ausgangsbuchse an der eine Rechteckspannung von \approx 2 kHz CAL

und eine Amplitude von 3 V_{s-s} ±1% zur Verfügung steht. Für Messkopfkompensation und/oder Prüfung der Vertikalablenk-

genauigkeit.

Eingangsbuchse an der Rückseite des Geräts gestattet Betrieb External Supply

mit einer externen Gleichspannung.

1st vor dem Anschluss an das örtliche Netz, den in Abschnitt Netzspannungs-

Umschalter 2.1.2 gegebenen Angaben entsprechend, einzustellen.

2.3. BEDIENUNGSANLEITUNG

2.3.1. Einschalten des Geräts

Vor Anschluss des Geräts an eine Stromquelle sind die in Abschnitt "Inbetriebnahme" gegebenen Anleitungen genauestens auszuführen.

Das Gerät wird normalerweise nach einer Anwärmzeit von etwa 15 Minuten den Spezifikationen (siehe Abschnitt 1.2) entsprechen. Wenn das Gerät jedoch grosser Kälte ausgesetzt war (z.B. unter Frostbedingungen nachts im Auto gelassen) und danach in einen warmen Raum gebracht wird, ist eine Anwärmzeit von etwa einer halben Stunde einzuhalten (siehe Abschnitt 1.2.8.).

2.3.2. Vorbereitende Einstellungen

Mit diesem Verfahren lässt sich feststellen ob der Oszillograf ordnungsgemäss funktioniert und es ergibt einen tauglichen Ausgangspunkt für den Beginn von Messungen.

Siehe Abb. 2.2. bezüglich der Lage der Bedienungselemente. Bringe die Einsteller INTENS und FOCUS in Mittelstellung. Taste AUTO drücken und mit Schalter TIME/DIV einen durchschnittlichen Zeitkoeffizienten zwischen 10 µs/div und 10 ms/div wählen. Mit allen übrigen Drucktasten in Normalstand (nicht gedrückt) lassen sich die Schreibstrahlspuren von Kanal A und Kanal B mit dem entsprechenden Einsteller POSITION auf dem Bildschirm darstellen.

Mit Bedienungselement INTENS eine mittlere Bildhelligkeit und mit FOCUS eine gute Strahlfokussierung einstellen.

2.3.3. Eingangskopplung (AC/DC,0)

AC-Kopplung (Drucktaste eingedrückt) dient zum Sperren der Gleichspannungskomponente eines Signals. Die AC Einstellung unterdrückt die Niederfrequenzen, wodurch sinusförmige Signale niedriger Folgefrequenz abgeschwächt werden und Rechtecksignale niedriger Folgefrequenz verformt werden. Der Abschwächungsgrad wird von der Eingangs RC-Zeit (0.1s) bestimmt.

Eingangs RC-Zeit wird 10-fach erweitert wenn 10: 1 passive Messköpfe verwendet werden.

Wenn auf AC-Kopplung geschaltet wird dauert es etwa fünf Eingangs RC-Zeiten bevor der Strahl auf den Mittelwert des Eingangssignals stabilisiert ist.

AC-Stellung Messungen können nicht gegenüber Erde vorgenommen worden.

In Stellung 0 wird das Eingangssignal unterbrochen und der Verstärkereingang kurzgeschlossen, dies zur Ermittlung des Nullpegels.

DC-Kopplung (Drucktaste normal) ermöglicht Frequenzeingang über den gesamten Bereich, dass heisst bis himb auf Gleichspannung.

2.3.4. Anwendung von Messköpfen

1: 1 passive Messköpfe sollten nur für Gleichspannung und Niederfrequenzen eingesetzt werden. Kapazitive Belastung schwächt hohe Frequenzen ab oder erhöht die Anstiegszeit von Messignalen (abhängig von Quellimpedanz).

10 : 1 passive Messköpfe besitzen eine kleinere kapazitive Belastung; gewöhnlich etwa 10 pF bis 20 pF. FET-Messköpfe sind besser, besonders wenn Messungen von Messpunkten mit hoher Impedanz vorgenommen oder an der oberen Frequenzgrenze der Bandbreite des Oszillografen ausgeführt werden sollen.

10 : 1 passive Messköpfe müssen vor Gebrauch ordnungsgemäss kompensiert werden. Ungenaue Kompensation hat Impulsverformung oder Amplitudenfehler bei hohen Frequenzen zur Folge.

Für genaue Einstellung kann der CAL-Ausgangsanschluss verwendet werden (siehe Abb. 2.3.).

2.3.5. Einstellen der gechoppten (CHOP) oder der alternierenden (ALT) Darstellungsart

Im Zweikanalbetrieb (CHOP oder ALT eingedrückt) muss für relative lange Ablenkzeiten (von .1 ms/div bis .5s/div) oder bei vorkommender niedriger Ablenk-Folgefrequenz selbst bei kurzen Ablenkzeiten, die Darstellungsart CHOP verwendet werden (CHOP eingedrückt).

Stellung ALT würde unter diesen Umständen Vergleiche zwischen Signalformen erschweren da sonst die beiden Signale gesondert wahrgenommen würden.

Wenn die Darstellung jedoch schnell genug ist um von der Chopperfrequenz unterbrochen zu werden muss die alternierende Darstellungsart eingestellt werden (ALT eindrücken), gewöhnlich bei Ablenkzeiten schneller als .1 ms/div.

Fig. 2.3. Die Kompensation von passiven 10:1 Messköpfen und der Einfluss auf Signalformen

2.3.6 Differentielle Betriebsart

Betriebsart A – B lässt sich durch Drücken von ADD und Ziehen des Knopfes POSITION von Kanal B einstellen. Bei Messungen wobei Signalleitungen bedeutende Gleichtaktsignale führen (z.B. Brumm) hebt die differentielle Betriebsart diese Signale auf, und lässt den Rest, der von Bedeutung ist, übrig. Die Fähigkeit des Oszillografen für Unterdrückung von Gleichtaktsignalen ist vom CMR-Faktor gegeben (siehe Abb. 2.4). Um den spezifizierten Grad der Gleichtaktunterdrückung zu erlangen müssen erst die Kanal A und B Verstärkungen ausgeglichen werden. Dies wird durch Anschluss beider Kanäle an den CAL-Ausgang und durch Einstellung eines der stufenlosen Einstellelemente mit dem Schalter AMPL/DIV auf Minimum-Ablenkung am Bildschirm erreicht.

Bei Verwendung von passiven 10:1 Messköpfen ist ein ähnliches Ausgleichsverfahren zu empfehlen und zwar durch ihre Kompensationseinstellung auf Minimum-Ablenkung zu bringen.

Fig. 2.4. Gleichtaktunterdrückung

2.3.7. Einstellen der Triggerart

(AUTO AC DC TV +/-)

Betriebsart AUTO ist äusserst nützlich, da dabei das Bild stets sichtbar ist, auch wenn keine Triggersignale vorhanden sind. Ausserdem bewirkt diese Betriebsart für eine Signalamplitude die grösser ist als ein Teil (div.) eine stabile Triggerung unabhängig von der Stellung des Pegeleinstellers LEVEL; ihr Bereich wird automatisch auf den Spitze-Spitzewert des für Triggerung gewählten Signals eingestellt.

Auf diese Weise wird die LEVEL-Einstellung bei kleinen Amplituden des Triggersignals erleichtert. Betriebsart AUTO lässt sich für Signale mit niedriger Folgefrequenz (10 Hz oder niedriger) nicht verwenden weil dies freilaufende Ablenkung zwischen Triggerimpulsen ermöglichen würde. Deshalb ist bei Signalen niedriger Folgefrequenz die normale Triggerung anzuwenden (AC oder DC gedrückt).

Bei normaler Triggerung wird die Zeitablenkung nur dann ausgelöst wenn ein Triggersignal angelegt wird und LEVEL entsprechend eingestellt ist.

Mit gedrücktem AC oder DC ist der Bereich des Einstellers LEVEL festgesetzt (+ oder – 8 Teile (div.) oder mehr in den äussersten Stellungen von LEVEL, bezogen auf die Bildschirmmitte).

Die Gleichspannungskomponente des Triggersignals lässt sich durch Eindrücken von AC sperren. Dies ist nützlich wenn bei einem Wechselspannungsignal das einem hohen Gleichspannungspegel überlagert ist getriggert werden soll. Bei AC-Kopplung verändert der Pegel bei welchem die Darstellung beginnt mit Änderungen im Mittelwert des Triggersignals. Dies kann bei Signalformen die im Zeitabstand von Zyklus zu Zyklus variieren Instabilität zur Folge haben. Normalerweise ist Anwendung der DC-Stellung vorzuziehen. Flankenwahl ist mit Drucktaste +/— vorzunehmen. Bei Betriebsart TV ist für negative Videosignale "—" einzustellen und "+" für positive Videosignale. Einsteller LEVEL ist bei Betriebsart TV nicht wirksam. Eine zusätzliche Anwendungsweise wird geboten wenn keine Tasten eingedrückt sind, eine Zeitablenklinie ist am Bildschirm sichtbar während kein Triggersignal vorhanden ist, und der Pegelbereich des Einstellers LEVEL fest ist.

2.3.8. Triggerquelle

Die Triggerquelle wird mit den Frontplatte-Drucktasten TRIG or X DEFL eingestellt.

A B EXTLINE

COMP

Die Triggerquelle wird mit den Frontplatte-Drucktasten TRIG OR X DEFL eingestellt.

- -Interne Triggerung ist die im allgemeinen meist angewandte, da sie nur ein Signal erfordert (das Eingangssignal) um stabile Triggerung zu erlangen.
- -Externe Triggerung. Falls mehrere Signale abgetastet werden, ist es günstig ein externes Signal zur Triggerung zu benutzen. Bei einer Änderung des Eingangssignals ist Einstellung und Neueinstellung der Trigger-Bedienungselemente (LEVEL, SLOPE und SOURCE) nicht nötig. Ausserdem bleiben die beiden Eingänge A und B für Untersuchungen der Signalformen verfügbar.
- -Wahl der Triggerquelle. Bei Vergleichung von Signalformen die ein Vielfaches ihrer Frequenz sind, immer das Signal mit der niedrigsten Folgefrequenz als Triggersignal wählen. Wenn nicht, könnten Doppelbilder (gechopped) oder falsche Zeitverschiebungen (alternierend) entstehen.
- —Zusammengesetzte (composite) Triggerung. Bei interner Triggerung werden Triggersignale von entweder dem A-Kanal, den B-Kanal Vorverstärkerstufen oder wenn in Stellung COMP durch Eindrücken der beider Tasten A und B, von der Verzögerungsleitungs-Treiberstufe die dem elektronischen Kanalschalter folgt, erhalten.

Zusammengesetzte Triggerung bietet drei Vorteile:

- 1. In der differentiellen Betriebsart (A-B Messungen) wird die Triggerung vom Differenzsignal ausgelöst. Die Triggerung wird nicht von Gleichtaktsignalen gestört.
- 2. Für Einkanal-Betrieb ist es nicht nötig Triggerquellen von A nach B oder umgekehrt zu schalten.
- 3. In alternierender Betriebsart lassen sich Signale vergleichen, die nicht in zeitlicher Beziehung stehen.

Bemerkung: Bei Anwendung zusammengesetzter Triggerung in Zweikanalbetrieb (gechopped oder alternierend) und wenn dabei nur ein Signal angelegt ist (an Eingang A oder B), ist stabile Triggerung nicht erlangbar. Das ist nicht ungewöhnlich, da die Triggerquelle auch von A nach B geschaltet wird (siehe Abb. 2.5.).

- Netztriggerung von der 50 Hz Netzspeisung ist nützlich wenn der Signaleingang Netzfrequenz bezogen ist.

MA 9365

Fig. 2.5. Blockschaltbild der zusammengesetzte (composite) Triggerschaltung

3.3.9. XY Messungen

Für XY Messungen steht der Schalter TIME/DIV auf X DEFL, die Quelle der Horizontalablenkung wird mit Drucktaste EXT X DEFL oder TRIG (A, B, EXT oder LINE) eingestellt.

XY Messungen ergeben ein zweckmässiges Mittel für Frequenz- oder Phasenverschiebungsvergleiche durch Darstellung mit Lissajous Figuren. Messungen bis zu 100 kHZ sind möglich, wobei der Phasenfehler zwischen den Oszillografkanälen geringer als 30 ist.

Nachstehende Tabelle zeigt die Empfindlichkeit der verschiedenen XY-Betriebsarten.

1. Généralités

1.1. INTRODUCTION

L'oscilloscope 25 MHz à double trace PM 3212 est un instrument compact et léger, de conception ergonomique et à possibilités de mesure étendues.

Un écran de 8 x 10 cm, à graticule interne, une trace de forte intensité et des caractéristiques telles que le déclenchement TV, des modes de déclenchement commutables et des modes d'addition pour la voie verticale, rendent cet instrument approprié à une large gamme d'applications.

Une alimentation à double isolement permet de connecter le châssis directement à des circuits de terre flottants, à condition qu'ils ne présentent pas de tension dangereuse au toucher.

De plus, il y a réduction substantielle du parasitage par les courants de terre, dont sont fréquemment affectés les oscilloscopes mis à terre.

L'emploi de l'oscilloscope à pied d'oeuvre est facilité par la possibilités du fonctionnement sur batterie.

ATTENTION: La masse du châssis (et le câble de masse de sonde) ne doivent pas être connectés à des circuits sous tension dangereuse au toucher.

Fig. 1.1. Oscilloscope 25 MHz à double trace PM 3212

CARACTERISTIQUES 1.**2**.

Sauf indications contraires, les propriétés exprimées en valeurs numériques tolérancées sont garanties pour des températures ambiantes comprises entre +5 °C et +40 °C. Les valeurs numériques non tolérancées sont des valeurs normales et représentent les caractéristiques d'un instrument moyen.

2. Mode d'emploi

2.1. Installation

2.1.1. Règlements de sécurité (conformes à la IEC 348)

Avant de brancher l'instrument sur le secteur, examiner le coffret, les commandes, les connecteurs, etc. pour s'assurer qu'il n'y a pas eu de dommages en cours de transport. Si l'on constate des défauts, ne pas brancher l'instrument.

Il faut déconnecter l'instrument de toute source de tension et décharger les points sous haute tension avant d'effectuer aucun travail d'entretien ou de réparation. Si les réglages ou l'entretien ne peuvent se faire autrement que sur l'instrument en marche, couvercles déposés, le travail devra être confié à un spécialiste conscient des risques encourus. L'alimentation étant à double isolement, il n'est pas nécessaire de mettre l'appareil à la terre en fonctionnement normal.

ATTENTION: Il ne faut pas oublier qu'en cours de fonctionnement la masse du châssis de l'oscilloscope est portée au même potentiel que la connexion de terre de la sonde de measure.

Ni le câble de masse de la sonde, ni le châssis ne doivent être connectés à des sources de tension dangereuse au toucher.

2.1.2. Branchement sur le secteur et fusibles

Avant de brancher l'appareil sur le secteur, s'assurer qu'il est réglé sur la tension correcte. A sa livraison, l'instrument est réglé sur 220 V. S'il doit être utilisé sur du 110 V, 127 V ou 220 V, il faut l'adapter en modifiant la position du carrousel sur le panneau arrière (voir figure 2.1.).

L'instrument est protégé contre les surcharges par un fusible thermique monté entre les enroulements du transformateur secteur. Pour replacer le fusible, il faut déposer le panneau arrière de l'instrument (voir section 3.2.).

Fig. 2.1. Vue arrière de l'oscilloscope avec carrousel en position 110 V

2.1.3. Branchement sur une alimentation extérieure

On peut connecter une alimentation extérieure ou batterie de 21 à 27 V, capable de fournir au moins

1A, sur la prise du panneau arrière.

Le conducteur intérieur doit être connecté au pôle négatif, le conducteur extérieur au pôle positif, comme indiqué sur le panneau arrière.

L'instrument est protégé contre les surcharges et contre le changement de polarité par une diode et un fusible internes.

2.1.4. Couvercle avant et position de l'instrument

Pour enlever le couvercle avant, il suffit de le tirer vers soi. On peut employer l'instrument en position horizontale ou suivant plusieurs inclinaisons en se servant de la poignée de transport comme support. Pour déverrouiller la poignée, enfoncer simultanément les deux boutons de pivotement centraux.

2.2. COMMANDES ET PRISES

2.2.3 Déclenchement

Commutateur de mode

Fonction

Choix du mode de déclenchement et de la polarité de transition du déclenchement par cinq boutons-poussoirs.

Si aucun bouton-poussoir n'est enfoncé, il y a automatiquement sélection du mode automatique et la gamme de niveau est fixe.

Il y a affichage d'une trace en l'absence de signaux de déclenchement. La gamme de réglage du niveau est proportionnelle à la valeur crête à crête du signal de déclenchement.

Déclenchement normal et gamme fixe de réglage du niveau. Le composant continu du signal de déclenchement est bloqué.

Déclenchement normal et gamme fixe de réglage du niveau. Le composant continu du signal de déclenchement est transmis.

Il y a synchronisation ligne ou trame suivant la position du commutateur TIME / DIV (trame de. 5s /div à 50µs/div et ligne de 20µs/div ă, 2µs/div)

de déclenchement

AUTO

AC

DC

ΤV

Le balayage est déclenché sur les flancs positifs au négatifs du signal de déclenchement. En TV, il faut choisir .les signaux vidéo négatifs et + pour les signaux vidéo

positifs.

LEVEL

Commande pour le réglage continu du niveau de la forme d'onde sur laquelle l'affichage doit commencer.

TRIG OR X DEFL

(voir commutateur de source TRIG OR X DEFL dans la section 2.2.4. ci-dessous).

2.2.4. Déviation horizontale

Commutateur de source

TRIG OR X DEFL

Fonction

Quatre boutons-poussoirs permettent de choisir la source de déclenchement ou la source de déviation horizontale si le commutateur TIME/DIV est en position X DEFL. Si auccun des boutons-poussoirs n'est enfoncé, la source A est

choisie.

Α В Signal fourni par la voie A.

Signal fourni par la voie B.

COMP (A & B tous deux enfoncés; inopérant avec

X DEFL)

Signal fourni après le commutateur électronique.

EXT

Signal externe fourni à prise adjacente 1 Mohm//20 pF.

LINE

Signal fourni par la tension secteur (inopérant si

l'instrument est alimenté par batterie).

X POSITION **X MAGN**

Commande de réglage continu du décalage horizontal de la trace; comporte un bouton tirette qui multiplie par 10 la déviation horizontale.

TIME/DIV (bouton

Choisit la vitesse de balayage entre 0,2 μ s/div et 0,5 s/div dans une progression 1-2-5.

extérieur)

Choisit entre déclenchement ligne ou trame dans le mode TV. En position X DEFL, la déviation horizontale est déterminée par

le commutateur TRIG ou X DEFL.

TIME/DIV (bouton

central)

Réglage continu des vitesses de balayage. Doit être en position CAL (c'est à dire en position extrême droite) pour l'étalonnage de l'axe du temps suivant l'indication du commutateur

TIME/DIV.

2.2.5 Divers

CAL

Prise de sortie fournissant une onde carrée de ≈ 2 kHz et une amplitude 3 Vcc ± 1%. A utiliser pour compenser la sonde et,

ou contrôler la précision de la déviation verticale.

Alimentation externe

Une prise d'entrée à l'arrière de l'instrument permet de le faire fonctionner sur une alimentation externe en courant continu. Tension d'alimentation de référence 21 à 27 V, courant

admissible > 1 A.

Adaptateur de tension

secteur

Le régler conformément à la section 2.1.2, avant de brancher

l'instrument sur la tension secteur locale.

2.3. INSTRUCTIONS D'UTILISATION

2.3.1. Mise de l'instrument en circuit

Avant de connecter l'instrument à une source quelconque d'alimentation, il faut exécuter soigneusement les instructions de la section 2.1.

Normalement, l'oscilloscope fonctionne conformément à ses spécifications (voir section 1.2.) après une période d'échauffement d'environ 15 minutes. Toutefois, s'il à été exposé à une ambiance extrêmement froide, (par example laissé la nuit dans une voiture par temps de gel) et qu'on l'amène dans une pièce chauffée, il faut tenir compte d'une période d'échauffement suffisante (voir 1.2.8.).

2.3.2. Réglage préliminaire des commandes

Les opérations décrites ci-après donnent une indication générale de la correction de fonctionnement de l'oscilloscope. Elles constituent un préalable utile à l'exécution des mesures.

Voir la figure 2.2. pour la position des commandes.

Mettre les commandes INTENS et FOCUS en position médiane. Enfoncer AUTO et choisir une vitesse de balayage moyenne comprise entre 10 µs/div et 10 ms/div à l'aide du commutateur TIME/DIV. Les autres boutons-poussoirs étant en position normale (non enfoncés), on peut positionner la trace des voies A et B sur l'écran à l'aide des commandes appropriées. Donner aux traces une brillance moyenne à l'aide de la commande INTENS et régler leur netteté à l'aide de la commande FOCUS.

2.3.3. Couplage d'entrée (AC/DC, 0)

Le couplage AC ou capacitif (bouton enfoncé) permet de bloquer le composant continu d'un signal. Le choix du couplage capacitif limite les fréquence inférieures, provoquant ainsi l'atténuation des signaux sinusdoidaux à faible fréquence et la distortion des ondes carrées à faible frequence. Le degré d'atténuation est d'erminé par le temps d'entrée RC (0.1s). Le temps d'entrée RC est multiplié par 10 si l'on emploie des sondes passives 10:1.

Lorsqu'on passe au couplage capacitif, il faut attendre environ cinq fois le temps d'entrée RC avant que la trace se stabilise à la valeur moyenne du signal d'entrée. Les mesures de position AC ne peuvent être faites par rapport à la masse.

La position 0 déconnecte la source d'entrée et court-circuite l'entrée de l'amplificateur pour le contrôle du signal zéro.

Le couplage DC ou continu (bouton libéré) couvre toute la bande passante, c'est à dire jusqu'au courant continu.

2.3.4. Emploi de sondes

Les sondes passives 1 : 1 ne doivent être employées que pour le courant continu et les basses fréquences. La charge capacitive atténue les hautes fréquences ou augmente le temps de montée des signaux de mesure (en fonction de l'impédance de source).

Les sondes passives 10:1 ont une charge capacitive moins grande, généralement environ 10 pF à 20 pF. Les sondes FET sont supérieures, en particulier si les mesures doivent être prises en des points à impédance élevée ou à la limite supérieure de la bande de fréquence de l'oscilloscope.

Les sondes passives 10 : 1 doivent être compensées correctement avant emploi. Une compensation incorrecte provoque la distorsion des impulsions ou des erreurs d'amplitude aux fréquences élevées. Pour un réglage correct, on peut utiliser la prise de sortie CAL (voir figure 2.3.).

2.3.5. Choix entre modes commuté et alterné

(A .. ALT .. CHOP .. ADD .. B)

En fonctionnement à double trace (CHOP ou ALT enfoncé), il faut choisir le mode commuté (CHOP enfoncé) pour des vitesses de balayage relativement faibles (de 0,1 ms/div à 0,5 s/div) ou pour des faibles fréquences de répétition du balayage, même s'il est rapide. Le choix du mode alterné (ALT) dans ces conditions rendrait difficile la comparaison des formes d'ondes, parce que les traces apparaîtraient en fait successivement. Toutefois, si l'affichage est assez rapide pour être interrompu par la fréquence de commutation, il faut choisir le mode alterné (enfoncer ALT), généralement pour des vitesses de balayage supérieures à 0,1 ms/div.

Fig. 2.3. Comment compenser les sondes passives 10:1 et l'effet sur les formes d'ondes.

2.3.6. Mode différentiel

On peut choisir le mode A-B en enfonçant ADD et en tirant la commande POSITION de la voie B. Dans les mesures au cours desquelles II y a réception de signaux de mode commun de valeur appréciable (par exemple ronflement), le mode différentiel annule ces signaux pour ne conserver que la valeur intéressante (A-B). L'aptitude de l'oscilloscope, à supprimer les signaux de mode commun est donnée par le coefficient de réjection mode commun (CMR) (voir figure 2.4).

Pour obtenir le degré spécifié de réjection mode commun, il faut tout d'abord égaliser les gains respectifs des voies A et B. On peut obtenir ce résultat en connectant les deux voies au connecteur CAL et en aiustant l'un des commutateurs AMPL/DIV pour une déviation minimale sur l'écran.

Si l'on emploie des sondes passives 10 : 1, il est recommandé d'employer une methode d'égalisation similaire consistant à régler leurs commandes de compensation pour une déviation minimale.

Fig. 2.4. Réjection en mode commun

2.3.7. Choix du mode de déclenchement

(AUTO .. AC .. DB .. TV .. +/-)

Le mode AUTO est des plus utiles parce qu'il fournit une trace ou plusieurs traces sur l'écran, même en l'absence de signaux de déclenchement. De plus, pour un signal d'amplitude supérieur à 1 division, ce mode fournit un déclenchement stable indépendamment du réglage de niveau (LEVEL); sa gamme est automatiquement réglée sur la valeur crête à crête du signal choisi pour le déclenchement.

Cela facilite le réglage du niveau (LEVEL) à faibles amplitudes du signal de déclenchement.

Le mode AUTO ne peut être employé pour les signaux à faible fréquence de répétition (10 Hz ou moins) parce qu'il y aurait alors balayage en relaxé entre les déclenchements. Il faut donc utiliser le déclenchement normal (AC ou DC enfoncé) pour les signaux à faible fréquence de répétition.

En déclenchement normal, il n'y a balayage que si un signal de déclenchement est fourni et que le réglage de niveau (LEVEL) est approprié.

AC ou DC étant enfoncé, la gamme du niveau est fixe (+ ou – 8 divisions ou plus de part et d'autre du milieu de l'écran). On peut bloquer le composant continu du signal de déclenchement en enfonç ant AC. C'est utile, si le déclenchement doit être provoqué par des signaux alternatifs superposés à un niveau continu important.

En couplage capacitif, le niveau auquel l'affichage commence varie avec les modifications de la valeur moyenne du signal de déclenchement. Le niveau de référence du signal n'est donc plus rapporté au niveau de référence du signal. Ceci peut être une source d'instabilité des formes d'ondes avec variation de leur durée d'un cycle à l'autre. Il est normalement préférable d'employer la position DC.

Le choix de la pente s'effectue à l'aide du bouton-poussoir +/—. Dans le mode TV il faut choisir — pour les signaux vidéo négatifs et + pour les signaux vidéo positifs. La commande LEVEL est inopérante dans le mode TV

Le non enfoncement des boutons offre une possibilité supplémentaire: l'écran affiche une trace en l'absence d'un signal de déclenchement, mais la gamme de niveau est fixe.

2.3.8. Source de déclenchement

La source de déclenchement se choisit à l'aide des boutons-poussoirs TRIG ou X DEFL en façade.

A B EXTLINE

- Le déclenchement interne est le plus couramment employé parce qu'il ne demande qu'un signal (le signal d'entrée) pour obtenir un déclenchement stable.
- Déclenchement externe. Si l'on affichage de nombreux signaux, il est de se servir du signal externe pour le déclenchement. Il n'est pas nécessaire de régler à nouveau les commandes de déclenchement (LEVEL, SLOPE et SOURCE) à chaque changement de signal d'entrée. De plus, les deux entrées A et B restent libres pour l'examen des formes d'onde.
- Choix de la source de déclenchement. Pour comparer les formes d'ondes dont les fréquences sont des multiples les unes des autres, toujours choisir comme source de déclenchement le signal qui à la frequence de répétition la plus faible.
 - Sinon, on risque d'obtenir des images doubles (mode commuté) ou des décalages de temps incorrects (mode alterné)
- Déclenchement mixte. Dans le mode interne, les signaux de déclenchement sont fournis par les étages préamplificateurs de la voie A, ou de la voie B ou encore, si on choisit COMP en enfonçant à la fois les boutons A et B, par l'étage de commande de ligne à retard qui suit le commutateur électronique.

Le déclenchement mixte offre trois avantages.

- 1. Dans le mode différentiel (A-B) le déclenchement est assuré par le signal différential et n'est donc pas perturbé par les signaux de mode commun.
- 2. Pour le fonctionnement monovoie, il n'est pas nècessaire de commuter les sources de déclenchement de A à B ou vice-versa.
- 3. Dans le mode alterné, il est possible de comparer des signaux sans relation chronologique.

Remarque: Si on emploie le déclenchement mixte en fonctionnement bivoie (commuté ou alterné) et qu'un seul signal est fourni (à l'entrée A ou B), on ne peut obtenir un déclenchement stable. C'est normal vu que la source de déclenchement est également commutée de A à B (voir figure 2.5.).

- Le déclenchement par la fréquence secteur 50 Hz est utile si le signal est lié à la fréquence secteur.

Fig. 2.5. Schéma synoptique du circuit de déclenchement mixte

2.3.9, Mesures XY

Les mesures XY s'effectuent avec le commutateur TIME/DIV en X DEFL, la source de déviation horizontale étant choisie à l'aide du EXT X DEFL ou du bouton-poussoir TRIG (A, B, EXT ou LINE). Les mesures XY constituent un moyen utile de comparer des fréquences ou d'étudier des déphasages par l'affichage de figures de Lissajous.

Les mesures peuvent se faire jusqu'à 100 kHz avec une erreur de phase inférieure à 30 entre les voies de l'oscilloscope.

Le tableau suivant indique la sensibilité dans les différents modes XY:

 X DEFL
 SENSIBILITE

Fig. 3.1. Block diagram of the oscilloscope

3. Service data

3.1 BLOCK DIAGRAM DESCRIPTION

3.1.1 Y Channel

The vertical channels A and B for the signals to be displayed are identical, each comprising an input coupling switch, and input step attenuator, an impedance converter and a preamplifier with trigger pick-off. A channel multivibrator, controlled by the display mode pushbuttons, switches either channel A or channel B to the final Y amplifier via the delay line. The channel multivibrator is operated by a pulse at the end of the sweep, and offers an uninterrupted display of the A and B waveforms in the ALT mode. In the CHOP mode the multivibrator is free-running and provides a chopped display of the two signals. In the ADD position, both switching amplifiers are connecting the signals through thus adding channels A and B. By inverting the B channel amplifier (PULL TO INVERT B) the A — B mode is obtained.

The AMPL/DIV switches provide x1 or x10 gain control of the preamplifier, which offers in conjunction with the step attenuator a full range of deflection coefficients in a 1-2-5 sequence.

3.1.2 Triggering

To initiate sweeps, trigger signals can be derived from the A and B vertical channel preamplifiers, from an external source, or internally from the mains supply (LINE triggering) as selected by the trigger source switch. With A and B pushbuttons both depressed, composite triggering is derived from the delay-line driver stage. The polarity of the trigger signal, negative or positive-going, on which the display will start is determined by changing the output polarity of the impedance convertor.

With the AUTO switch depressed, the peak-to-peak level detector comes into operation. The peak-to-peak level of the signal then determines the range of the LEVEL control.

With AC or DC depressed, the range of the LEVEL control is fixed.

In the TV mode the LEVEL control is inoperative and the TV sync separator is switched into circuit, thus initiating sweeps with line or frame pulses as dictated by the setting of the TIME/DIV switch.

3.1.3 Time-base circuit

For normal internal time-base operation the horizontal amplifier is fed by sweeps from the time-base circuit.

With AUTO depressed, in the absence of trigger signals, the output of the sweep generator is fed back via the hold-off circuit and gate to its input. This causes sweeps to free-run and a resultant trace is displayed on the screen. As soon as the AUTO control circuit detects a trigger (i.e. a change in the output of the sweep-gating logic) the sweep is fed back to the sweep-gating logic. This causes the circuit to revert to the normal triggering mode in which sweeps are initiated only by trigger pulses at the input of the sweep-gating logic.

With AC or DC depressed, AUTO control is made inoperative. Sweeps are then only produced provided a trigger signal is present and the LEVEL control appropriately set.

The display can be magnified in the horizontal direction by increasing the gain of the final amplifier.

In the EXT position of the TIME/DIV switch, the sweep generator output to the final amplifier is inhibited and the impedance convertor is connected directly to the final amplifier. In this way, the signals normally selected for triggering, or an external source, can now be used for horizontal deflection.

3.1.4 Hold-off circuit

The hold-off stage, as its name implies, 'holds-off' triggers from the input of the time-base circuit until the trace has completely returned and the time-base circuits are completely reset.

3.1.5 Z Axis

The Z amplifier provides for the blanking of the trace during the fly-back and hold-off time. In addition, it blanks the sweep in the CHOP mode during the switching transients.

The l.f. components of the blanking signal are modulated and demodulated before they are applied to the Wehnelt cylinder together with the a.c. coupled h.f. components.

Fig. 3.2. Removing the instrument covers and the carrying handle

Fig. 3.3. Pivot centre button

3.1.6 Power supply

The mains (line) supply is transformed and rectified before being applied to a d.c. to a.c. regulator.

When the instrument is operated from a battery supply the battery output is connected directly to the d.c. to a.c. regulator.

The output of the regulator is coupled to a transformer and rectifier which, after rectification, provides the -1.5 kV e.h.t. potential and the circuit supply lines. The -1.5 kV is also multiplied to 8.5 kV to supply the required total accelerating voltage of ≈ 10 kV.

3.2. DISMANTLING THE INSTRUMENT

3.2.1. General information

This section provides the dismantling procedures required for the removal of components during repair and routine maintenance operations. All circuit boards removed from the oscilloscope should be adequately protected against damage, and all normal precautions regarding the use of tools must be observed.

During dismantling procedures, a careful note of all leads disconnected must be made so that they may be reconnected to their correct terminals during assembly.

Always ensure that the mains supply is disconnected before removing any instrument cover plates.

Damage may result if the instrument is switched on when a circuit board has been removed, or if a circuit board is removed within one minute of switching off the instrument.

3.2.2. Removing the instrument covers.

The instrument is protected by three covers: a front panel protection cover, a wrap-around cover with carrying handle, and a rear panel.

To facilitate removal of the wrap-around cover and the rear panel, first ensure that the front cover is in position.

Then proceed as follows:

- hinge the carrying handle clear of the front cover; to this end, push both pivot centre buttons A (Fig. 3.2.).
- stand the instrument on its protective front cover on a flat surface.
- slacken the two coin-slot screws located on the rear panel
- lift the rear panel and unplug the connector on the power supply board.
- lift off the wrap-around cover
- for access to the front-panel, stand the instrument horizontally and snap off the front cover.

3.2.3. Removing the carrying handle

- Prise off the centre knobs from each pivot, using a screwdriver (Fig. 3.3.) in one of the small slots at the sides
 of the knobs
- Remove the cross-slotted screws that are now accessible
- Bend both arms of the handle slightly outwards and take it off the cabinet
- Grip and arms of the carrying handle must be ordered separately (see list of mechanical parts). A complete carrying handle can easily be constructed by pressing the arms into the grip.

3.2.4. Removing the bezel and the contrast plate

- Take hold of the bezel's bottom corners and gently pull it from the front panel.
- The contrast filter can be removed by pressing it gently out of the bezel.

3.2.5. Removing the knobs and the text plate

- The channel B POSITION and the X POSITION knobs can be removed after prising off the knob caps and unscrewing the slotted nuts that are then accessible.
- The remaining small knobs can be pulled off the shafts
- The AMPL/DIV and TIME/DIV switch knobs can be removed after prising off the knob caps and unscrewing the hexagonal nuts that are then accessible
- When the knobs have been removed, the text plate can be taken off after removing the hexagonal nuts of the AMPL/DIV and the TIME/DIV switches.

3.2.6. Removing the front assembly

In order to gain access to parts on the AMPL/DIV switches, to replace trimmer capacitors or other components on the attenuator board, it is best to remove the front panel assembly as a whole in accordance with the following procedure:

- Remove the instrument covers in accordance with section 3.2.2.
- Remove the INTENS, FOCUS and ILLUM knobs by pulling them off the shaft
- Remove the earthing terminal at the front
- Remove the three screws A (Fig. 3.4.)
- Remove the two screws B that hold the attenuator to the frame bar (Fig. 3.5.)
- Remove the three screws C (Fig. 3.6.)
- Make a note of the positions of the miniature socket connections on the amplifier board
- Remove all plugs, miniature sockets, coaxial sockets and clamping terminals from the unit and the amplifier
- Remove the complete front assembly from the instrument; screening covers can then be removed to gain access
 to and remove parts
- When the front panel assembly is reinstalled, make sure not to interchange the connections of the Y position controls. The connections are correct when the trace shifts upwards if the Y position control is rotated clockwise.

3.2.7. Replacing switches

3.2.7.1. General

- To replace the AMPL/DIV switches, first remove the front panel assembly (section 3.2.6.)
- To replace the TIME/DIV switch, first remove knobs and text plate (section 3.2.5.)
- If one of the push-button switches of the trigger source selector (A, B, EXT, LINE) or the input coupling switch (AC/DC 0) must be replaced, it is best to remove the front panel assembly first (section 3.2.6.).
 The defective switch is then replaced in accordance with the procedure described below.
- To replace one of the push-button switches of the vertical mode switch (A, ALT, CHOP, ADD, B) or the trigger mode switch (AUTO, AC, DC, TV, SLOPE), the amplifier board can be removed if so desired and the defective switch is then replaced as described below.

3.2.7.2. Replacing a switch of a push-button unit

- Straighten the 4 retaining lugs of the relevant switch as shown in Fig. 3.7.
- Break the body of the relevant switch by means of a pair of pliers and remove the pieces. The soldering pirs are then accessible
- Remove the soldering pins and clean the holes in the printed-wiring board (e.g. with a suction soldering irm)
- Solder the new switch on to the printed-wiring board
- Bend the four retaining lugs back to their origional positions
- N.B. The ALT switch is a dummy switch which can be replaced by a not self-releasing type.

3.2.8. Replacing the cathode-ray tube

- Remove the instrument covers and rear frame (section 3.2.2.)
- Remove bezel and contrast plate (section 3.2.4.)
- Unplug the connectors on the c.r.t. neck
- Ease the base socket off the c.r.t.
- Slacken the brace around the c.r.t. neck

Fig. 3.6. Removing the front assembly (scews C)

Fig. 3.7. Replacing a push-button switch

Fig. 3.4. Removing the front assembly (screws A)

Fig. 3.5. Removing the front assembly (screws B)

Fig. 3.8. Replacing the thermal fuse

- Unplug the trace rotation coil connector on the amplifier board and pull cable and plug through the elongated hole in the centre frame
- Withdraw the c.r.t. through the front panel until the e.h.t. connector at the side of the tube becomes accessible
- Remove the e.h.t. connector
- Take the c.r.t, out of the instrument via the front panel; mind the wire and plug of the trace rotation coil
- Install a c.r.t. in reverse order; position the c.r.t. screen flush with the contrast plate. The torque applied to the screw of the brace around the c.r.t. neck must be between 0,4 and 0,6 Nm.

3.2.9. Removing the mains transformer

- Remove wrap-around cover and rear panel (section 3.2.2)
- Take the lid off the voltage adapter compartment after removing the 4 cross-slotted screws.
- Remove the 4 cross-slotted screws that hold the lid of the transformer compartment
- Lift the lid with the attached transformer, simultaneously sliding the wire form between transformer and voltage adapter out of the slit in the transformer compartment.
- The transformer and thermal fuse are then accessible for replacement

3.2.10. Replacing the thermal fuse

- Remove the mains transformer (section 3.2.10)
- Unsolder fuse terminals 1 and 2 (Fig. 3.8.)
- Only the fuse wire of the old fuse is replaced and not the complete fuse; to this end, bend the housing of the
 fuse slightly outwards, disengage the locking pin and pull out the wire
- Take the new fuse and remove the fuse wire out of its housing in the same way as described above
- Push the new fuse wire into the housing of the old one until the locking pin snaps into the hole. The loop in the fuse wire must point to terminal 1
- Solder the fuse wire to terminals 1 and 2.

3.2.11. Replacing the delay line unit

- If there is a defect in the delay line, the complete delay line unit must be replaced.
- Replacement is self-evident, but take care not to interchange the connections at the same end of the delay line; interchange the connections when rotating the POSITION control clockwise, results in a downward movement of the trace

CODING SYSTEM OF FAILURE REPORTING FOR QUALITY ASSESSMENT OF T & M INSTRUMENTS

(excl. potentiometric recorders)

The information contents of the coded failure description is necessary for our computerized processing of quality data.

Since the reporting of repair and maintenance routines must be complete and exact, we give you an example of a correctly filled-out PHILIPS SERVICE Job sheet.

TEST AND MEASURING EQUIPMENT

OSC₁

25MHz Dual channel oscilloscope PM 3212

Re. Extra in- and output circuits; Battery model PM 3212B

1. **EXTRA IN- AND OUTPUT CIRCUITS**

The PM 3212 is equipped with facilities to add three extra in- and output circuits with a minimum of components. The in- and output BNC sockets are mounted in the holes above the c.r.t. socket; only 15-mm-holes must be drilled in the plastic rear cover (figure 1), on the positions as indicated.

1.1. External Z-modulation input

1.1.1. Characteristics

1.1.2.

- TTL Compatible
- Current drain at 0 V: -3 mA; at +5 V: +1 mA
- Brightness: light from +2 V to +7 V maximum dark from +0,8 V to -1,2 V minimum

- Rise time from light to dark and vice versa: 50 ns

- Delay time from input socket to screen: 85 ns
- Required components

- Coax. cable (per metre)

5322 320 10003

- BNC connector

5322 267 10004

- Filler ring for BNC connector

5322 532 24319

- Nut for BNC connector

5322 506 14001

1.1.3. Fitting the input

Connect one end of the coax, cable to the points indicated in Fig. 2 and the other end to the BNC connector which has been mounted on to the rear of the oscilloscope as described in section 1. Make sure that the coaxial cable is also earthed at the BNC connector end.

Time-base sweep output 1.2.

1.2.1. Characteristics

— Output voltage: minimum level -1,8 V

maximum level +3,8 V ± 0,5 V

- Internal resistance: 1 kohm

- The output is protected against short-circuits

1.2.2. Required components

Coax. cable (per metre)	5322 320 10003
 BNC connector 	5322 267 10004
- Filler ring for BNC connector	5322 532 24319
 Nut for BNC connector 	5322 506 14001
Resistor 1 kohm	5322 116 54549
- Resistor 1,27 kohm	5322 126 50555
- Transistor BC548C	5322 130 44196

1.2.3. Fitting the output

- Fit the BNC connector as described in section 1.
- Fit the resistors as indicated in Fig. 2.
- Fit the transistor as indicated in Fig. 2.
- Connect one end of the coaxial cable to the points indicated in Fig. 2. and the other end to the BNC connector.
- Make sure that the coaxial cable is also earthed at the BNC connector end.

1.3. Time-base gate out

1.3.1. Characteristics

- Output voltage: high level more than +2,7 V

low level less than 0,5 V

- Internal resistance: 50 ohm

- The output is protected against short-circuits

1.3.2. Required components

- Coax. cable (per metre)	5322 320 10003
- BNC connector	5322 267 10004
- Filler ring for BNC connector	5322 532 24319
- Nut for BNC connector	5322 506 14001
- Resistor 51,1 ohm	5322 116 54442

1.3.3. Fitting the output

- Fit the BNC connector as described in section 1
- Fit the resistor as indicated in Fig. 2.
- Connect one end of the coaxial cable to the points indicated in Fig. 2 and the other end to the BNC connector.
- Make sure that the coaxial cable is also earthed at the BNC connector end.

2. BATTERY-POWERED OSCILLOSCOPE PM 3212B

The oscilloscope PM 3212B is a model PM 3212 with built-in batteries and charging circuit. All data of the standard model PM 3212 also apply to the PM 3212B model with exception of the following (all these data apply with the batteries inside).

2.1. Temperature range

Without batteries Same as standard model PM 3212

With batteries: mains supply -10 °C . . . +35 °C

battery supply $-10~^{\rm o}{\rm C}\ldots$ +40 $^{\rm o}{\rm C}$ during quick charge $-10~^{\rm o}{\rm C}\ldots$ +45 $^{\rm o}{\rm C}$

2.2. Batteries to be used

Maintenance-free lead-acid batteries, 8 V 3 Ah, e.g. Sonnenschein 4Gx3S.

2.3. Operating time with fully charged batteries and graticule illumination at minimum

With uninterrupted use 3 hours minimum; with 50 % on and 50 % off 3 hours and 15 minutes (maximum

'on' duration 30 minutes).

The internal battery is automatically switched off if the voltage drops below 22,3 V. This prevents excessive discharge of the batteries and use of the oscilloscope at a too low supply voltage.

2.4. Battery quick charge

Time required

approximately 10 hours from fully discharged to fully charged

Power consumption

13 W at maximum

Maximum charging current

0,3 A

Charge indication

POWER ON pilot LED blinks once every second

End of charge indication

POWER ON pilot LED blinks once every three seconds

Internal batteries are fully protected against overcharge when aparatus remains in "charge" position for an indefinite periode of time.

2.5. Power consumption with mains supply

Same as standard PM 3212. If the batteries are fully discharged the power consumption is approximately 1 W higher.

2.6. Weight

The instrument with built-in batteries weighs 11 kg.

2.7. Capacitance in relation to earth

Measured with instruments feet standing on an earthed metal plate \geq 1 m²: 160 pF. Measured with instrument 30 cm above an earthed metal plate \geq 1 m²: 23 pF.

2.8. Supply possibilities

Requirements — Condition	Mains plug connected to mains (line)	ON/OFF to ON	External battery connected to rear socket
Instrument operates on mains supply and internal battery is trickle charged with 30 mA	Yes	Yes	No
Instrument operates on charged internal batteries	No	Yes	No
Internal battery is quickly charged	Yes	No	-
Instrument operates on external battery	No	Yes	Yes
Instrument operates on mains supply or external battery (depending on voltage) and internal battery is trickle charged with 30 mA	Yes	Yes	Ƴes
Instrument is switched off and batteries disconnected	No	No	_

2.9. Parts list (supplementary to the standard PM 3212)

ITEM	URDERING NUMBER	FARAD	TOL (%)	VOLTS	REMARKS

Subject: Alteration of /01/02/03 versions.

- The service ordering number for the line cable clamp on the rear panel of the /01/ and /02/ versions is 5322 290 44028.
- Page 103 of Instruction Manual 9499 440 17402

Item 20 must be grip

5322 466 64162

Item 22 must be bracket

5322 498 54072

- The service ordering number of the GM-type C.R.T. D14-125 GM/08 is 5322 131 24049.
- During the production of the /02/ version the following modifications are introduced:
 - An improved type of line cable cleat is used (Item 35 on page 103 of the Instruction Manual 9499 440 17402) Service ordering number: 5322 325 64083.
 - Potentiometer R3 of 1 k Ω is replaced by a potentiometer with an improved switch. Service ordering number: 5322 101 44036.
 - To improve the bandwidth of the vertical amplifier the resistors R816 and R818 are removed and replaced by interconnection wires.
- During the prodcution of the /03/ version the under mentioned modifications are introduced:
 - To decrease the tolerance in the length of the trace when LINE is selected in the X-Deflection mode (the length of the trace should then be 8 divisions) capacitor C201 is replaced by a capacitor of 3,3 nF. Service ordering number: 4822 122 30099.
 - For improvement of drift properties FET transistor pairs V504 and V604 (ON 561) are replaced by the FET transistor pairs BFS 21A.

Service ordering number: 5322 130 40709.

The turn of trimming potentiometer R1232 is increased from about 30° to about 270°.

R1222 is replaced by 5,11 k Ω

5322 116 54595

R1223 is replaced by 7,5 k Ω 5322 116 54608 R1229 is replaced by 14,7 k Ω

5322 116 54632

R1236 is replaced by 3,83 k Ω

5322 116 54589

R1230 of 10,5 k Ω (5322 116 50731) is inserted between the junction of V1218 - R1229 and the junction of R1232 - R1236.

The positions of R1229 and V1218 have been interchanged.

OSC 36

OSCILLOSCOPE PM 3212

Already published: OSC 1 - OSC 27 Subject: Alteration of the /04 version.

- During the production of the /04 version the following modifications are introduced:
 - . The REED relais K501, K601 and K1401 are replaced by the type with service ordering number 5322 280 24103.
 - . Resistor R1416 is replaced by 287 Ω (5322 116 54506) for better adjustment of the GAIN X10 by R1419.
 - . For better adjustment of the GAIN X1 of the A vertical amplifier the values of the following resistors have been changed.

R541 is replaced by 215 Ω

5322 116 50457

R542 is replaced by 169 Ω

5322 116 54489

- . C503 and C603 of 33pF are introduced in parallel with R517 and R617 respectively. This is done for better bandwidth adjustment and better h.f. response in the 2-5-10 mV/div. positions of the attenuator switches.

 Service ordering number: 4822 122 31067.
- . To decrease the temperature effect on the bandwidth, capacitors C512 C514 C612 and C614 are removed. Also the resistors R556 R557 R656 and R657 are removed and replaced by interconnection wires.
- An improved type of 50Ω sockets and plugs is used.
 - Coaxial socket, vertically 5322 268 24116 mounted on p.c. boards.
 - Contact pin for coax. socket 5322 268 14141
 - Set of coaxial cables

Subject

: Alteration of the /05 and /06 versions

- During the production of the /05 version the following modifications are introduced:
 - Diodes V201, 202, 203 and 204 (BY127) are replaced by diodes of type BY227. (Service ordering number 5322 130 34633).
 - For better performance in X-deflection via Y $_A$ and Y $_B$ the 30.1 Ω resistors R552, 553, 652, 653 are replaced by 34.8 Ω resistors (Service ordering number 5322 116 54027)
- During the production of the /06 version the following modifications are introduced:
 - To obtain a better bandwidth in the 2mV/div position the following components have been changed: C817 33pF connected between R822 and ground (Service ordering number 4822 122 31067) C819 22nF removed, R816, R818 30.1 Ω instead of interconnection wires.D801 instead of CA3085 now SL 3145E.
 - To prevent oscillations in the X-deflection circuit C1402 has been changed from 22nF into 100pF and C1403 is removed.

OSCILLOSCOPE PM 3212

Already published: OSC 1 - OSC 27 - OSC 36 - OSC 47

Subject: 1. Alteration of the /06 version

- 2. Alteration of the /07 version
- 3. Survey of publications to be used for the several versions

1. During the production of the /06 version the following modifications are introduced:

- To obtain a better square wave response capacitor C608, (8,2 pF) is replaced by a trimming capacitor of 22 pF (4822 125 50045)
- To prevent oscillations in the X-amplifier capacitor C1402 is changed from 100 pF to 1nF (4822 122 31175)

2. During production of the /07 version the following modifications have been introduced:

- To improve the quality trimming capacitor C318, 5,5 pF is changed to another type of 3pF (5322 125 54026)
- To prevent oscillations two capacitors of 33 pF (4822 122 31067) are added:
 C510 between R552/R553 and ground
 C610 between R652/R653 and ground
- To simplify production the following values are changed:

R812	was	2,2 k Ω	new	4,7 kΩ	5322	100	10114
R813	was	4,7 k Ω	new	10 kΩ	5322	100	10113
R814	was	1kΩ	new	$2,2$ k Ω	5322	101	14008
C808	was	68 pF	new	47 pF	4822	122	31072
C809	was	22 pF	new	40 pF	4822	125	50092
C811	was	22 pF	new	40 pF	4822	125	50092

– To obtain a better "gain X1" adjustment R852 and R853 are changed from 44,2 Ω into 55,1 Ω (5322 116 54442).

3. Publications to be used for version:

Version	Manual	Service information	Main differences

/07	9499 443 00602	OSC 79 part 2 only	Complete upgrading*

^{*} The amplifier PCB of the PM 3212/07 is identical to the PM 3216 amplifier PCB except for the hold-off circuit components and some bandwidth determining components.

NOTE: For the PM3212 B the above mentioned manuals together with manual 9499 443 01202 have to be used.

re: New AMPL/DIV and TIME/DIV switches with gold contacts.

reason: Better quality!

For Service purposes, the AMPL/DIV and TIME/DIV switches of the PM3212-fam. are replaced by gold contact versions.

In future automatically these switches are delivered from Concern Service.

The following list includes a survey of the new switches with gold contacts.

D	escription	Code nr.	Used in PM	Remarks
	PL/DIV switch	5322 105 30		Set of 2 switches
			3217,3218,3219,3305	
TI	ME/DIV switch	5322 278 90	0511 3212	incl. var.control
				and inner shaft.
TI	ME/DIV switch	5322 282 10	0201 3215,3216	
	B TIME/DIV switch	5322 278 90	0512 3214	incl. var.control
				and inner shaft.
МТ	B TIME/DIV switch	5322 282 10	0203 3217,3218	
	B TIME/DIV switch	5322 276 11	1203 3219	
	B TIME/DIV switch			incl. var.control
0 1	2 12, 2 2			and inner shaft.
דת	B TIME/DIV switch	5322 282 10	0204 3217,3218	
	B TIME/DIV switch			

As additional information the following list includes the inner shafts for the switches.

Inner shaft for	AMPL/DIV switch, used in PM3215 and PM3217	5322 535 91655
	AMPL/DIV switch, used in PM3219	5322 535 91219
Inner shaft for	TIME/DIV switch, used in PM3215	5322 535 91654
Inner shaft for	MTB or DTB switch, used in PM3217	5322 535 91653
Inner shaft for	MTB or DTB switch, used in PM3219	5322 535 70622

Betr.: PM 3212 und PM 3214, Transistorausfall im Triggerverstärker

In der Betriebsart "Triggerung extern mit AC-Kopplung" werden beim Umschalten auf interne Triggerung die Transistoren V 352 bei PM 3212 bezw. V 352 oder V 453 bei PM 3214 zerstört, wenn an dem externen Triggereingang ein Gleichspannungspegel von z.B. 200 Volt anliegt.

C 1003 bezw. C 1001/1101 entlädt sich in vorgenannte Transistoren. Je nach Polarität der extern angelegten Gleichspannung können auch noch weitere Transistoren vor den genannten defekt werden.

Die Zerstörung von V 352 und V 453 kann durch Einbau von je 3 Schutz⊸ dioden BAW 62 verhindert werden.

Einbauposition siehe beiliegende Schaltbilder.

Mit freundlichen Grüssen
